User Story Number: US004.08

User Story Name: Store Exam Result with EDIPI

Priority: High

ClearQuest Number: DAS_CR214

Author: David Komraus/Analyst

Story: As a consuming application, I want to store exam results using the Electronic Data Interchange Personal Identifier (EDIPI) as the patient identifier so the exam result is available for retrieval by EDIPI in the disability claims adjudication process.

Background

The Department of Veterans Affairs (VA) and Department of Defense (DOD) have taken a major step forward in developing a joint lifetime record system with the VA's adoption, in 2010, of DOD's personal identifier (the EDIPI) for each service member. The Virtual Lifetime Electronic Record (VLER) Initiative will use the DOD's EDIPI for all its health and benefits records for veterans. The VLER Initiative will track each record with the EDIPI, in addition to continuing to use some of the other legacy identifiers, when the EDIPI is not available. The EDIPI is the primary patient identifier for the storage of exam results. Exam results consist of a Disability Benefits Questionnaire (DBQ), and possibly other supporting clinical information. If the EDIPI is not available for a patient when the exam result is being stored, then the exam result will be stored using the Integration Control Number (ICN). If a unique ICN is not available, the exam result will be stored using the Social Security Number (SSN).

Conversation

VLER DAS sends the exam result with the EDIPI as the patient identifier to the Health Data Repository (HDR) for storage, when the EDIPI is available.

Detailed Listing of Acceptance Criteria

Requirement ID	Description
US004.08.01	VLER DAS sends the exam result with the EDIPI as the patient identifier to the Health Data Repository (HDR) for storage, when the EDIPI is available.

Constraints

None at present.
